

A phone for a context! .

---

After the office, Julie leaves her computer, her heavy smartphone and her suit in her bedroom. She dresses for her jogging and takes a light and small mobile phone.

At no point in time, Julie has inserted a SIM card in the handset, nor entered any private information in the handset.

### **How does this works**

By touching the mobile phone, Julie starts the eGo pairing between the eGo compliant device (the mobile phone) and the eGo device (e.g. a watch,..). The eGo pairing done, the mobile phone and eGo have a logical channel of communication on which they can exchange data. For instance, the mobile accesses a remote SIM card located in the eGo.

Julie can switch from an handset to another easily without unfriendly handling of the mobile phones.
